CleverInsight

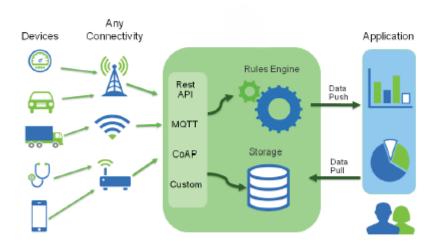

IOT - INTERNET OF THINGS

CleverInsight helps healthcare organizations examine patterns in rich data and provides analysis and recommendations for better commercial innovation, scientific discovery, real-world outcomes, and supply-chain manufacturing.

A widely read paper from Michael Chui at McKinsey popularized the idea of "The Internet of Things" – the idea that in the coming years, all devices will be connected through intelligent links to the Internet. And we mean ALL things: cars, refrigerators, light switches, your wallet, everything. Thus we circle back to manufacturing: where every machine, every scanner, every sensor, every worker is connected to the network and streaming data at an incredible rate, creating the first true example of the Internet of Things. And, not coincidentally, creating a high impact Big Data challenge at the same time.

Our advanced analytics provide value-added decision support to operations and to specify a preferred course of action. Such on-line data processing is known a Prescriptive Analytics. The mission-critical nature of the analytics requires rigorous design and thorough verification and validation (V&V). This is achieved by using model-based design, the models can be used in simulations

to verify the analytics. The models are built by Predictive Analytics based on historical operational data.

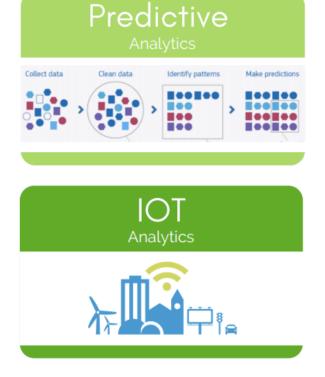

CleverInsight

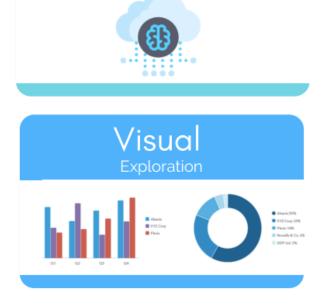

OUR CLIENTS INCLUDE

- Healthcare
- Manufacturing
- Automation
- Energy management
- Transportation

What We Offer:

Platform - Create your own models with our platform & visual components **Custom apps** - Hire us to build your domain-specific models as an application **Tools** - End-user exploratory tools to answer specific business problems

Cognitive

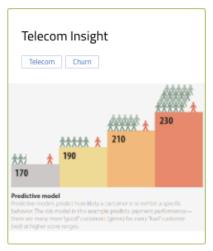

CleverInsight

Our Verticals:

Domain Experts:
